

Pi Calculation - Mini-Quiz

The concept of pi (π) has been around since the ancient Greeks. Your task is to calculate and print the value of pi to 4 decimal points, using `printf()` formatters and variables.

An approximation of pi is $22/7$. You should calculate this value as a floating point variable in a `.c` file, and print out the resulting variable to 4 decimal points. You will submit this file to the “pi_variables” repository on Github.

Hint: Use the “Print Formatting” notes to find `printf()` formatters.
